Adobe Photoshop is a graphics editor from Adobe Systems that is used to create images in the raster image format, both to produce publication-quality graphics and to produce pre-press and post-press documentation. This can be converted to other file formats such as JPEG and GIF. In addition, it can produce vector-based graphics including lines, shapes, text, and bitmap images. Photoshop has been the industry standard image manipulation program since it was introduced in 1987. The program enables users to edit raster images using a set of layers and multiple brushes that add to the image's overall appearance. Layers can be hidden, the user can alter the opacity of layers, and layers can be combined or moved from one document to another. The program supports multiple sizes of raster images and is often used for web graphics. It also supports background images, border effects, images of transparency, and new filters. In 2017, the software is still in use by many professionals as well as by hobbyists, and is available for personal and commercial use. Photoshop and other page layout software enable users to create high-quality production documents, such as magazines, books, and advertising leaflets. It can be used to design advertisements for print or broadcast publications or to create high-quality Web graphics. Some users of Photoshop also use the software to create images and artwork for the Web. It is one of the most important image-editing software tools for this kind of work, and there is a huge choice of tutorials to help users get started. In addition to the range of features offered by Photoshop, it offers some that are only available in 3rd party packages, such as the ability to convert images to other formats such as PDF and EPS, and the ability to convert EPS to JPG. The program can save images in the raster format and therefore only requires raster images as input, but it can also create vector-based graphics in a variety of formats. The software can be used to edit text, and it can be used to crop and filter images, while embedding objects such as clip art, logos, and photographs. Photoshop is suited to producing images for publishing, including magazines, books, and advertising leaflets. It is also suitable for creating graphics for the Web. Photoshop is available as a free download, but to use the software fully, users have to purchase a license. Photoshop operates

You can make adjustments to the overall image, as well as individual pixels, and you can create a wide range of adjustments and effects. Some of the most common adjustments include brightness, exposure, contrast and hue. Levels The Levels tool is a powerful tool that lets you set the overall brightness and contrast of an image. To understand why it is so powerful, we need to take a little time to understand the application. The Levels tool creates a histogram. In fact, the Levels tool allows you to create a histogram and it will display the individual levels (the steps) and the output (the results). You can find out which image is more important and

how to highlight that image in a different way. Using the Levels tool, you will be able to add, remove, or change any of the individual steps without changing the overall output. The Levels tool also offers a powerful feature that lets you fade the areas you want to focus on or subtract areas you don't. Q: How to extract the characters between bold words with Perl? I have a line in a file that has these characters: `|*-----*-----* |Cell=the quick brown fox |this| runs| over| the |lazy dog | |Link to this link |This is a link | The goal is to count how many characters there are between bold words and print the count. I used regular expression to achieve this: use strict; use warnings; use diagnostics; open my $fh, ' ' { $words = $_; } my $blanks = "$words "; if (m/^(.*)/) { $count = length($blanks); } This is the output: |*-----*-----* |Cell=the quick brown fox|this| runs| over| the |lazy dog | |Link to this link|This is a link| The problem is that I'm getting the wrong number of counts. I think it's because of the quotation marks around "Link to this link". I tried to do the same with $blanks = "$words "; but Perl doesn't like that. A: For something like that you don't need regular expressions. Here is a more Perl-idiomatic way. use strict; use warnings; open my $fh, ' ' { my $words = $_; $words =~ s/(\\S*)=(\\S*)/ $1 $2/eg; print " Words: $words "; foreach my $words_n (split / /, $words) { if ($words_n =~ /^(.*)/) { $count += length($words_n); $words_n =`
